Partial Discharges in Insulation Systems

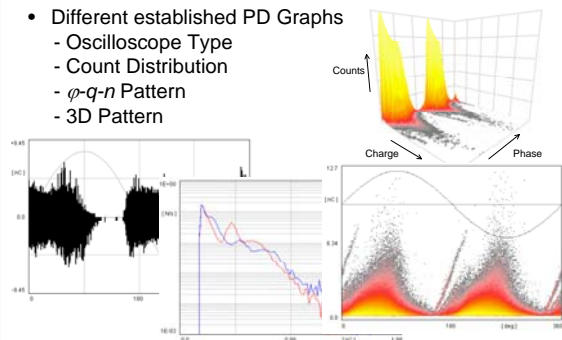

- Partial Discharge is the electrical Breakdown of a Part of the overall Insulation
- PD Activity is a Symptom of electrical Degradation as well as a cause of Insulation Degradation
- Technical Insulation Systems offer different Stability against Partial Discharge Activity
 - Polyethylene
 - EPR, EPDM
 - Oil-Paper
 - Epoxy-Mica
- Material correlated Defect Mechanism

WG C57.127, IEEE TC S14, Savannah, GA, USA, March 23rd-27th, 2014 © Power Diagnostix 3

Visualization of Partial Discharge Activity

- Different established PD Graphs
 - Oscilloscope Type
 - Count Distribution
 - ϕ - q - n Pattern
 - 3D Pattern

WG C57.127, IEEE TC S14, Savannah, GA, USA, March 23rd-27th, 2014 © Power Diagnostix 4

Partial Discharge Electrode Configurations

Surface dominance:

- Low

- Medium

- High

Type: Conductor Conductor, Conductor Gas, Conductor Isolator, Isolator Gas, Isolator Isolator

WG C57.127, IEEE TC S14, Savannah, GA, USA, March 23rd-27th, 2014 © Power Diagnostix 5

Properties of Insulation Materials

- Typical Breakdown Strength:
 - Air: 24 kV/cm bar
 - Hydrogen H₂: 16 kV/cm bar
 - SF₆: 88 kV/cm bar
 - Transformer Oil: ~150 kV/cm (20°C)
 - Epoxy Resin: ~300 kV/cm
 - Polyethylene: >500 kV/cm (Foil up to 8000kV/cm)
- Paschen's Law: $E_{Breakdown} \sim pd$ ($p > 1\text{bar}$)
 - Hydrogen cooled Generators: 3-7 bar
 - SF₆ insulated Switchgear: 3-4 bar
 - Temperature-modulated internal Pressure of embedded Voids

WG C57.127, IEEE TC S14, Savannah, GA, USA, March 23rd-27th, 2014 © Power Diagnostix 6

Occurrence of Partial Discharges

- For the Occurrence of Partial Discharge two Conditions must be met:
 - The local electrical Field must have reached the Streamer Inception Field ($E > E_{Stf}$)
 - A free Electron must be available to start the Discharge Avalanche
- Two main Processes to derive this initial Electron:
 - Ionization by Photons
 - Field Emission
- The statistical Properties of this Processes control the Appearance of the PD Pattern

WG C57.127, IEEE TC S14, Savannah, GA, USA, March 23rd-27th, 2014 © Power Diagnostix 7

Discharges in a spherical Gas Inclusion

No Discharge although $E > E_{Str}$

- Photon provides initial free Electron
- E Field accelerates the Electron
- Discharge Avalanche occurs

Charge Separation after Discharge

- Positive Gas Ions and Electrons
- Space Charges on the Surfaces
- Residual Field $E = E_{Res}$

Reversed Polarity during next Half Cycle

- De-trapping of Space Charge $E > E_{Str}$
- E Field accelerates the Electron
- Discharge Avalanche occurs

WG C57.127, IEEE TC S14, Savannah, GA, USA, March 23rd-27th, 2014 © Power Diagnostix 8

Discharges in a spherical Gas Inclusion

High Availability of Starting Electron

- Regular Discharge for $E > E_{Str}$
- Stable (low) Discharge Amplitude
- Regular PD Pattern

WG C57.127, IEEE TC S14, Savannah, GA, USA, March 23rd-27th, 2014 © Power Diagnostix 9

Discharges in a spherical Gas Inclusion

Low Availability of Starting Electron

- Random Discharge Occurrence for $E > E_{Str}$
- Higher Discharge Amplitude
- Distributed PD Pattern

WG C57.127, IEEE TC S14, Savannah, GA, USA, March 23rd-27th, 2014 © Power Diagnostix 10

Discharges in a spherical Gas Inclusion

Low Availability of Starting Electron

- Discharge Pattern indicates U/U_{Inc}
- $Q_{Max}/Q_{min} = 2(E_{Max} - E_{Res}) / (E_{Str} - E_{Res})$
- Line Type Pattern: $n \ll 1/f$ (recombination)
- Filled Pattern: $n \sim 1/f$ (space charges)

WG C57.127, IEEE TC S14, Savannah, GA, USA, March 23rd-27th, 2014 © Power Diagnostix 11

Discharges in a spherical Gas Inclusion

Asymmetrical Availability of Starting Electron

- Different Discharge Pattern per Half Cycle
- Pos. Half Cycle: Low Availability
- Neg. Half Cycle: Higher Availability

WG C57.127, IEEE TC S14, Savannah, GA, USA, March 23rd-27th, 2014 © Power Diagnostix 12

Discharges in a flat Delamination

Initial Process as with spherical Void

- Photon provides initial free Electron
- E Field accelerates the Electron
- Avalanche bridges the Gap

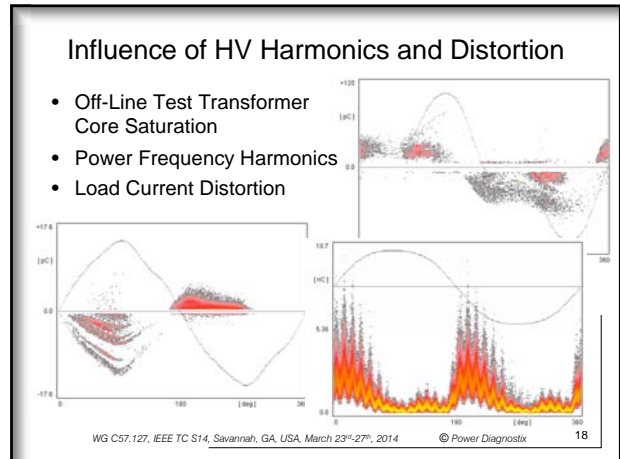

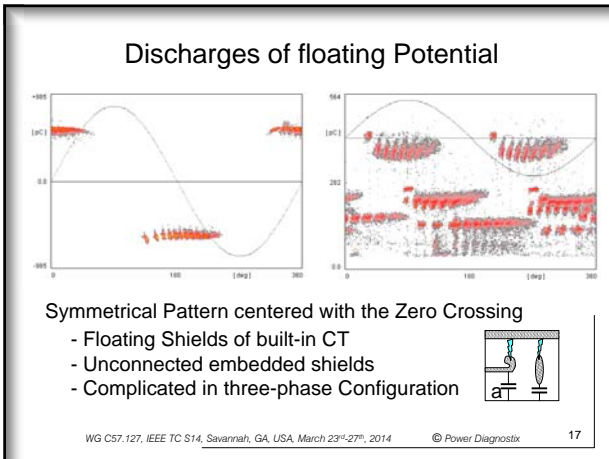

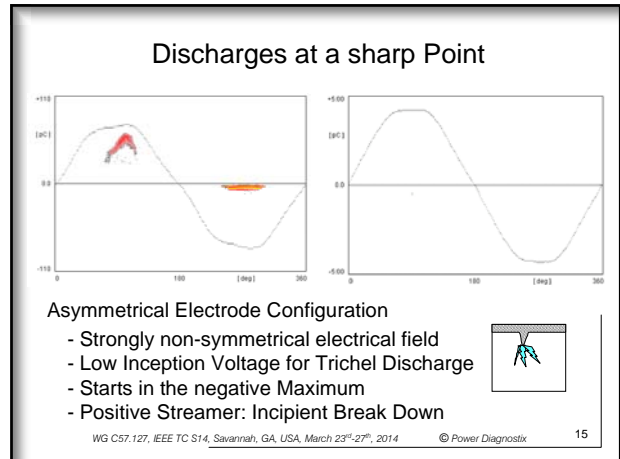

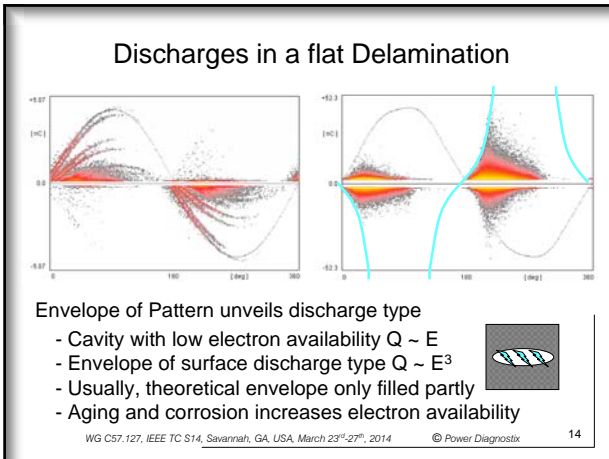

Transition into Surface Discharge

- Produces "Lichtenberg" Figure
- Radius $r \sim E$
- "Ideal" Delamination $> Q \sim E^3$

Influence of Surface Properties

- Different Materials
- Surface Conductivity
- Corrosion, Aging

WG C57.127, IEEE TC S14, Savannah, GA, USA, March 23rd-27th, 2014 © Power Diagnostix 13

Properties of Transformer Windings

- Highly complex Network
 - Cross-Coupling
 - Attenuation
 - Impedance Changes
- Complex Insulation System
 - Oil-Paper
 - Pressboard
 - Porcelain
 - Composite Bushing

WG C57.127, IEEE TC S14, Savannah, GA, USA, March 23rd-27th, 2014 © Power Diagnostix 19

Acceptance Testing of Power Transformers

WG C57.127, IEEE TC S14, Savannah, GA, USA, March 23rd-27th, 2014 © Power Diagnostix 20

Acoustic Triangulation - ideal vs. real

- "Textbook" Triangulation
- Real-life Transformer:
 - Interior not homogeneous
 - No uniform transmission Speed
 - Tank not a thin Membrane
- Multiple Transmission Paths
- Sound Speed in Transformer Oil:
 - 1400ms⁻¹ @ 20°C
 - 1200ms⁻¹ @ 80°C
- Solving "flat" Problems
 - horizontal
 - vertical

WG C57.127, IEEE TC S14, Savannah, GA, USA, March 23rd-27th, 2014 © Power Diagnostix 29

Transmission Paths in Transformers

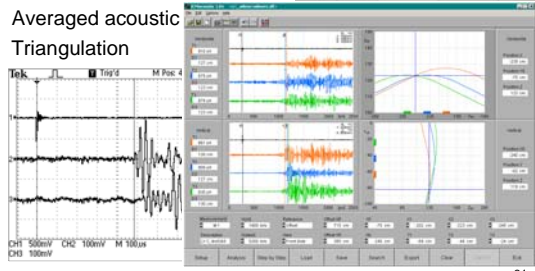

- Clear View, Angle < 30°
- Clear View, Angle > 30°:
 - Wall Signal arrives first
 - Location impossible, if all > 30°
 - Reposition sensors
- Higher Speed in Structure
 - Indicates closer Location
 - Moves with sensor position
- Source hidden deeply in Winding:
 - High attenuation
 - No straight sound path
 - False Location > Experience

WG C57.127, IEEE TC S14, Savannah, GA, USA, March 23rd-27th, 2014 © Power Diagnostix 30

Transmission Paths in Transformers

- Charge Injection (Sensor A)
- Received Signals (B & C)
- Triggering on el. PD Signal
- Averaged acoustic
- Triangulation

WG C57.127, IEEE TC S14, Savannah, GA, USA, March 23rd-27th, 2014 © Power Diagnostix 31

Acquiring Acoustic Signals

- Piezo-electric Sensor with Phantom Supply
- Remote controlled Battery operated Transmitter
- Fiber-optic Isolation
- Control Software

WG C57.127, IEEE TC S14, Savannah, GA, USA, March 23rd-27th, 2014 © Power Diagnostix 32

Case 1 - 30MVA Distribution Transformer

- 5nC at U_N on HV1
- Cross-coupling as with calibration coupling matrix
- Clear Oil Path
- Location just 14cm behind tank wall

WG C57.127, IEEE TC S14, Savannah, GA, USA, March 23rd-27th, 2014 © Power Diagnostix 33

Case 2 - 300MVA Shell Type Autotransformer

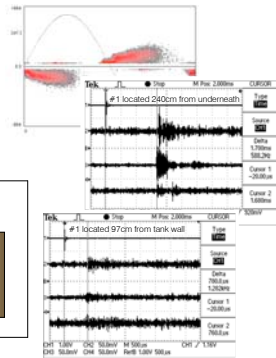

- Up to 15nC on common
- Floating Potential
- Limited Access due to Shell Type Design
- Location in ~100cm depth

WG C57.127, IEEE TC S14, Savannah, GA, USA, March 23rd-27th, 2014 © Power Diagnostix 34

Case 3 - 700MVA Grid Autotransformer

- About 1nC on common
- Paper Layer Delamination with Reverse Switch Wiring
- Poor Side Access due to Wall Shunts

WG C57.127, IEEE TC S14, Savannah, GA, USA, March 23rd-27th, 2014

© Power Diagnostix

35

Case 4 - Grid Transformer

- Single-Phase Excitation
- Three-Phase Excitation
- Calculating the differential electrical field
- Analyzing the Signal in Time-Domain

WG C57.127, IEEE TC S14, Savannah, GA, USA, March 23rd-27th, 2014

© Power Diagnostix

36

Case 4 - Grid Transformer

- Electrically acquired Pattern
- Acoustically acquired Pattern
- Comparing Intensity and Phase Shift versus Position

WG C57.127, IEEE TC S14, Savannah, GA, USA, March 23rd-27th, 2014

© Power Diagnostix

37

Case 4 - Grid Transformer

- Damped Wall Shunts hamper acoustic Emission
- Identifying the PD Source
- Bad Cleatbar Connection
- PD between HV and Tertiary

WG C57.127, IEEE TC S14, Savannah, GA, USA, March 23rd-27th, 2014
